

Emiel Azucena

Full Stack Developer

Initao, Misamis Oriental 9022 | 09658839558 | emiell.azucena@gmail.com

[Portfolio](#) | [LinkedIn](#)

Full Stack Developer with 4+ years of experience building and maintaining production systems for a regulated cooperative bank. I've worked on financial reconciliation, regulatory compliance reporting and real-time operations — usually as the sole developer, owning the whole thing from requirements gathering to deployment and ongoing maintenance. My day-to-day stack includes TypeScript, Node.js, React, MongoDB, and MSSQL. I'm also comfortable with JWT authentication, role-based access control (RBAC), WebSocket real-time systems, REST API integration, and containerized deployments using Docker and Nginx.

CORE TECHNICAL SKILLS

Language & Runtimes: TypeScript, JavaScript, NodeJS and PHP

Backend: ExpressJS

Frontend: ReactJS, Mantine UI, AG Grid, Handsontable, Bootstrap, Bulma CSS, JQuery, DataTables, WordPress

Real-time: Socket.IO, WebSocket

Databases: MySQL, Microsoft SQL Server (MSSQL) and MongoDB

Infrastructure & DevOps: Docker, NGINX , Apache, PM2 and Linux

Tools: VS Code and Postman

PROFESSIONAL EXPERIENCE

Taocrowd Inc.

Full Stack Developer – Contractor (April 2026 – May 2026)

- Maintained web applications using React and Node.js
- Developed responsive and dynamic user interface
- Backend API development with Node.js and PostgreSQL

REPSShield.

Full Stack Developer – Contractor (November 2025 – April 2026)

- Build and maintained reppshield app using React and Node.js
- Developed responsive and dynamic user interface
- Backend API development with Node.js and PostgreSQL

Mindanao Consolidated Cooperative Bank (MCCB)

Sr. Software Developer / Analyst (January 2023 – December 2025)

- Built and deployed full-stack web applications used daily across multiple bank departments — covering financial reconciliation, regulatory reporting, and internal operations.
- Integrated third-party REST APIs including an SMS gateway for bulk notifications and core banking systems for transaction data synchronization.
- Maintained and improved legacy applications built with Laravel and PHP — adding features, fixing bugs, and improving performance over time.
- Conducted requirements analysis through stakeholder interviews with department heads and end-users to translate business needs into technical solutions.
- Handled the full software development lifecycle (SDLC) on my own: design, build, test, deploy, and maintain.
- Worked with the IT infrastructure team and core banking specialists to make sure new systems connected properly with existing bank infrastructure.
- Deployed applications using Docker and Windows services, with Nginx and Apache as reverse proxies.

Mindanao Consolidated Cooperative Bank (MCCB)

Jr. Software Developer / Analyst (February 2021 – December 2022)

- Contributed to the development and maintenance of banking software systems, which improved transaction processing.
- Assisted in the execution of full-stack development projects, utilizing Node.js and ReactJS to build user-friendly applications.
- Participated in code reviews and technical discussions, continuous improvement and collaboration across the team.
- Supported senior developers in debugging and refining applications to maintain optimal functionality and compliance standards.

Misamis Oriental Sport Complex (MOISC)

IT Staff (June 2018 – December 2020)

- Managed the facility's IT infrastructure — computers, network equipment, and multimedia systems.
- Maintained the LAN and fixed connectivity issues across the complex.
- Handled technical requirements for live events including streaming, projection, and audio setups.

KEY PROJECTS

All projects built solo — full ownership from requirements through deployment and maintenance.

Regulatory Report System – Solo Developer

- A centralized compliance platform for generating and submitting regulatory reports. Built with AG Grid for data entry, entity code mapping, multi-level approval workflows, and role-based access control (RBAC) via configurable role templates.
- Added temporary permission grants with auto-expiry and a custom MongoDB-backed Token Bucket rate limiter.

Authentication Server – Solo Developer

- Centralized JWT-based authentication service acting as the single sign-on (SSO) point for all opt-in applications.
- Handles access and refresh token issuance and validation, password hashing, and has an admin UI built with AG Grid for managing users across systems.

ATM Reconciliation System – Solo Developer

- Automatically reconciles ATM transactions from ZIP archives, sorting them by type — cash withdrawals, balance inquiries, and etc.
- Connects to an external banking data source to pull raw transaction feeds and runs precise financial calculations to generate accurate settlement figures.

Election Management System – Solo Developer

- A member management and live election platform. TypeScript backend with domain-driven module structure, real-time voting via WebSocket, and SMS gateway integration for bulk member notifications.
- Includes background jobs for automated system maintenance

Queueing System – Solo Developer

- Real-time queue management system running across multiple service counters. Uses Socket.IO for instant updates to all connected screens.
- Has a customer-facing display with voice announcements and a separate control interface for staff.

Organization File Repository– Solo Developer

- *An internal document management system with category, subcategory, and tag hierarchy, plus full-text search across all metadata.*
- *Includes file versioning with modification history and an immutable audit log for every file operation.*

AG&J Realty Website – Solo Developer

- A custom WordPress site for a real estate company. Built with a customized theme and must-use (MU) plugins handling property listings, agent profiles, frontend filtering, custom user roles, and asset loading.
